Implement DNS for Your Application: Set up a DNS record to map your web application's IP or load balancer to a domain name.

Name: SAMRAJ K

Department : CSE

Introduction

Domain Name System (DNS) is a crucial component of web applications, enabling human-readable domain names (e.g., www.example.com) to be mapped to machine-readable IP addresses. This eliminates the need for users to remember complex numerical IP addresses, enhancing accessibility and user experience.

Objectives

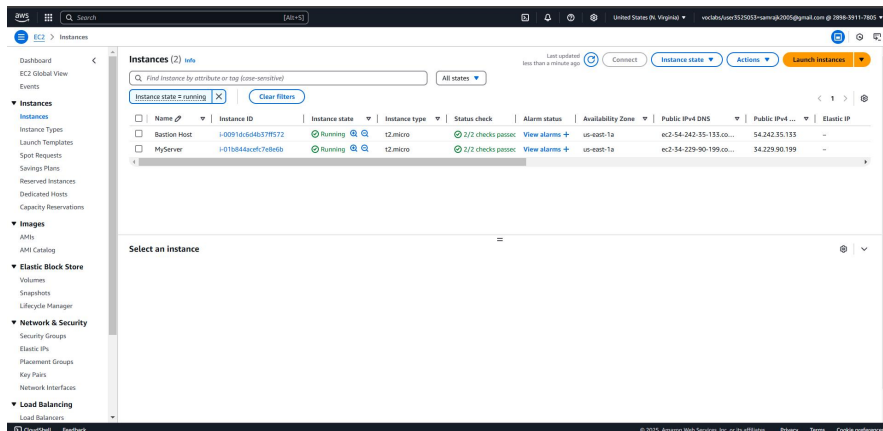

- Set up a DNS record using a cloud provider's DNS service (e.g., AWS Route 53).
- Map your web application's IP or Load Balancer to a domain name.
- Verify and test DNS resolution by accessing the domain in a web browser.

Step by Step Overview

1. Create an EC2 instance

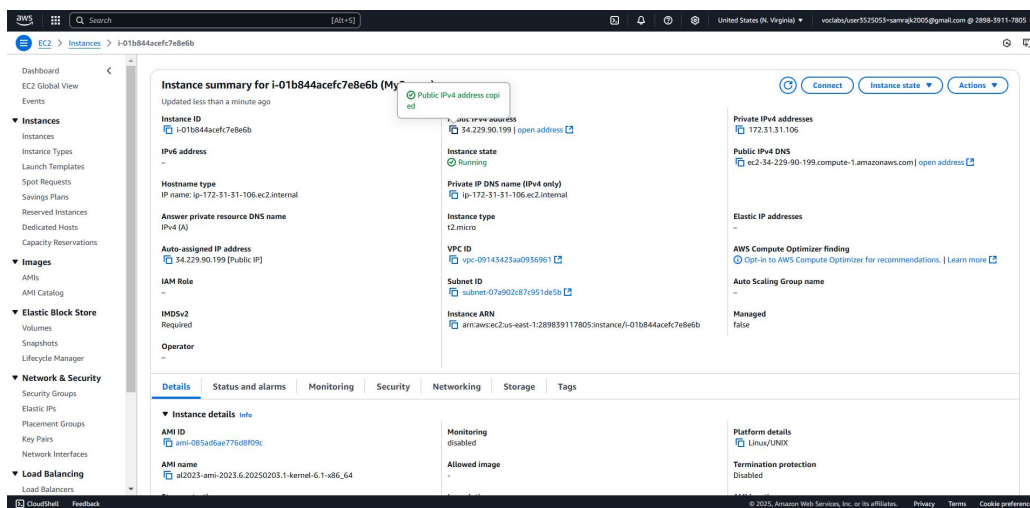

- log into your aws account.

- create an EC2 instance.

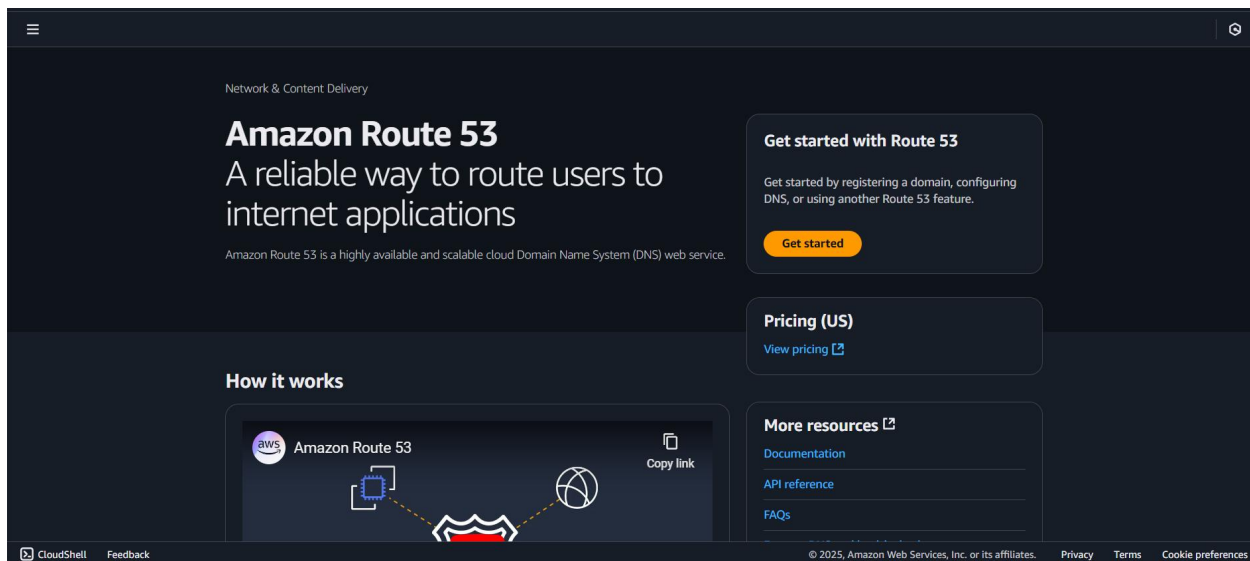

2. Open the EC2 dashboard

Find your instance and copy the Public IPv4 Address.

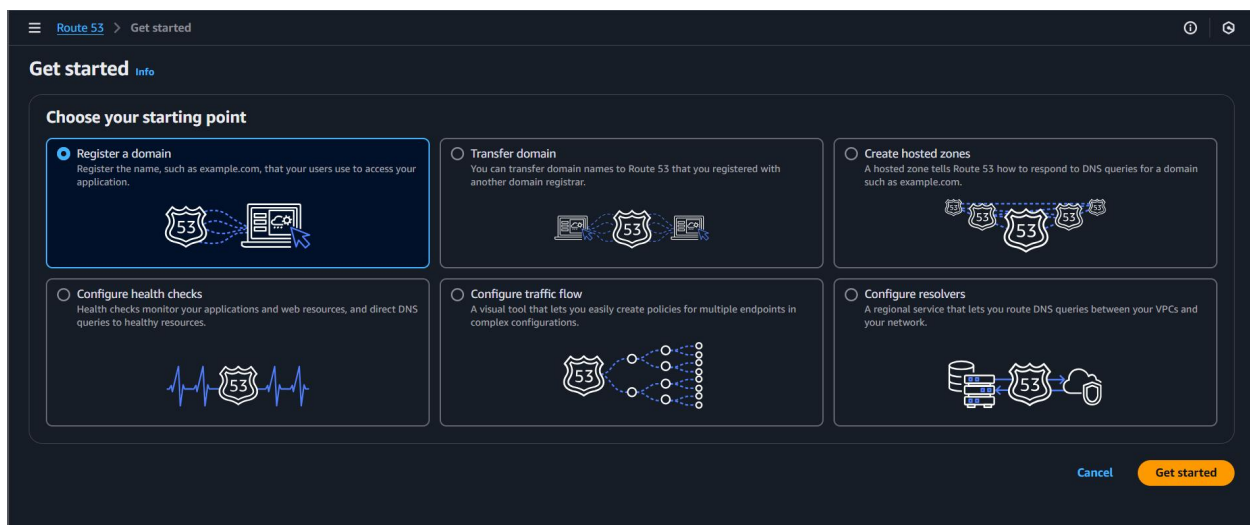

3. Register a domain name

- Open Amazon Route53

- Click **Register Domain** and follow the steps to purchase a domain.

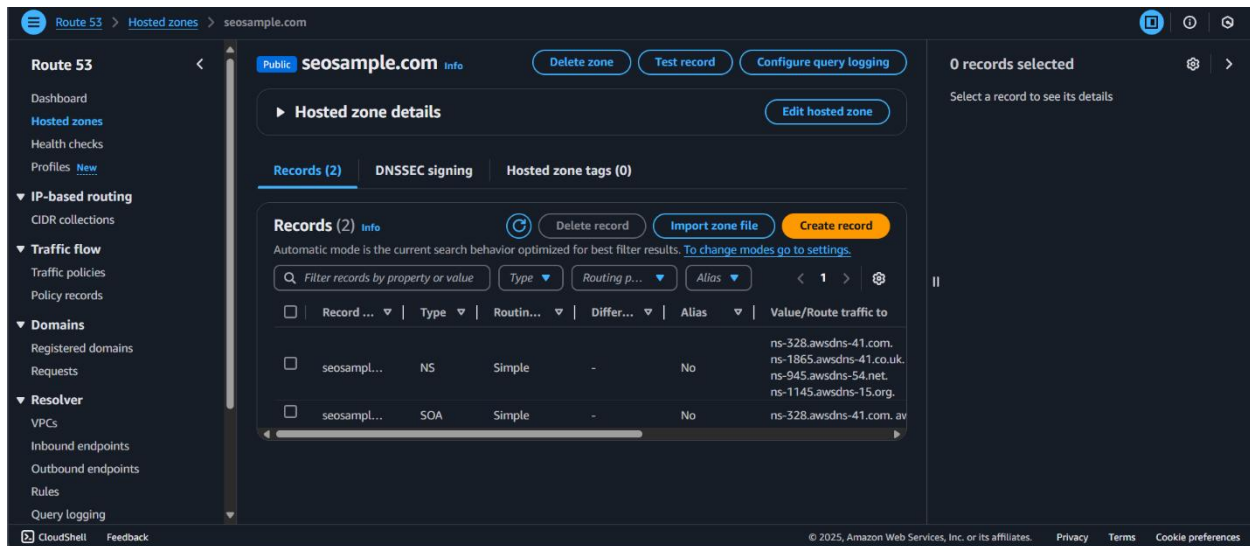

- Now you have successfully registered a Domain. (it might take a few minutes)

4. Hosted Zone

When you register the domain, AWS automatically creates a host zone.

5. Create Records

- Click **Create record**.
- Choose **Simple routing** → Click Next.
- Configure the record:
 - Record name: Leave blank for root domain (example.com) or enter www for www.example.com.
 - Record type: Choose **A – IPv4 address**.
 - Value: Paste your EC2 Public IPv4 Address (e.g., 3.123.45.67).
 - TTL: Keep default (300 seconds).
- Click Create record.

Route 53 > Hosted zones > seosample.com > Create record

Create record Info

Quick create record Switch to wizard

▼ Record 1 Delete

Record name Info subdomain seosample.com **Record type** Info A - Routes traffic to an IPv4 address and some AWS resources

Keep blank to create a record for the root domain.

☐ Alias

Value Info 15.207.71.54

Enter multiple values on separate lines.

TTL (seconds) Info 300 1m 1h 1d **Routing policy** Info Simple routing

Recommended values: 60 to 172800 (two days)

Add another record

Record for seosample.com was successfully created. View status ×
Route 53 propagates your changes to all of the Route 53 authoritative DNS servers within 60 seconds. Use "View status" button to check propagation status.

Public seosample.com Info Delete zone Test record Configure query logging

► **Hosted zone details** Edit hosted zone

Records (3) **DNSSEC signing** **Hosted zone tags (0)**

Records (3) Info Refresh Delete record Import zone file Create record

Automatic mode is the current search behavior optimized for best filter results. [To change modes go to settings.](#)

Type ▼ Routing p... ▼ Alias ▼ < 1 > Settings

<input type="checkbox"/>	Record ... ▼	Type ▼	Routin... ▼	Differ... ▼	Alias ▼	Value/Route traffic to
<input type="checkbox"/>	seosampl...	A	Simple	-	No	15.207.71.54

6. Verify the Domain

Wait a few minutes, then test if the domain resolves correctly.

Using **nslookup <domainname.com>** - you can test the configurations of your EC2 instance.

```
Server:  dns.google
Address:  8.8.8.8

Non-authoritative answer:
Name:     seosample.com
Address:  15.207.71.54
```

Outcome:

- Custom Domain Access
- Improved User Experience & Branding
- DNS Mapping to Web Application
- Verification of DNS Configuration
